

VW golf V xenon bulb installation procedure

The new VW golf V generation has a special halogen connector , there is no wire connections to the lamp:

1. for assembling the xenon lamp into the Golf headlamp here is what need to do:

take out the halogen lamp, take off the metal lines that attached to the plastic connector:

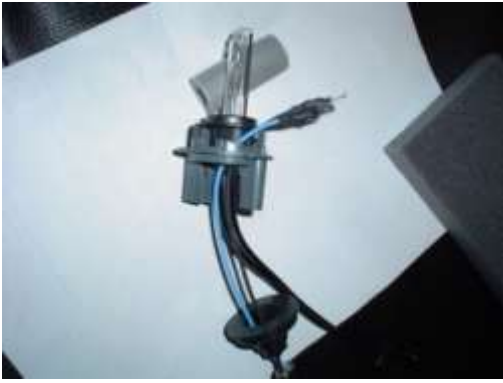

make a **18mm** hole in the center of the connector, make sure very well that its in the center:

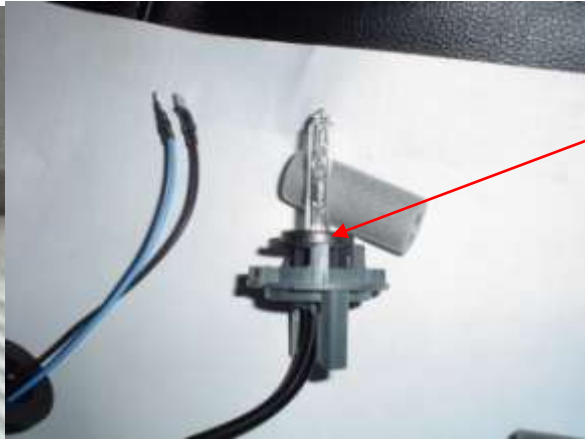

The Hole should pass all the way to the other side.

Pass the xenon lamp connector+12V wires thru the hole :

most important thing is to straightening the lamp exactly the same line like the halogen:

the wires that should be connected from the headlamp housing are yellow and brown:

yellow for the + and brown for the - , you should disconnect them from the housing , so the yellow wire need to connect to the xenon 12V blue wire and the brown wire to our black wire. Basically , that's it ,insert the connector into the lamp housing and place the ballast nearby it.
